In An Average Week in Arizona

- **192** babies are born preterm
- **28** babies are born very preterm
- **113** babies are born low birthweight
- **18** babies are born very low birthweight

**Preterm Birth Rates**
2010-2013 Average
Percent of live births (15 Counties)

- Over 12.7 (5)
- 11.6-12.7 (5)
- Under 11.6 (5)

Value ranges are based on an approximately equal number of counties in each range.

### Preterm and Low Birthweight Births in Arizona

- In 2013, there were 9,959 preterm births in Arizona, representing 11.6% of live births.(1)
- Between 2003 and 2013, the rate of infants born preterm in Arizona declined more than 11%.(1)
- During 2011-2013 (average) in Arizona, preterm birth rates were highest for black infants (15.7%), followed by Native Americans (14.2%), Hispanics (12.3%), Asians (11.7%) and whites (10.6%).(1)
- In 2005, the annual societal economic cost (medical, educational, and lost productivity) associated with preterm birth in the United States was at least $26.2 billion.(2)
March of Dimes National Prematurity Campaign: The Mission of the March of Dimes is to improve the health of babies by preventing birth defects, premature birth, and infant mortality. Prematurity is the leading cause of newborn death and a major determinant of illness and disability among infants, including developmental delays, chronic respiratory problems, and vision and hearing impairment. To address this growing problem, the March of Dimes has committed to a multi-year national prematurity research, awareness, and education campaign. For more information contact the pregnancy & newborn health education center at askus@marchofdimes.org or visit marchofdimes.org/mission/prematurity-campaign.aspx.

Risk Factors for Preterm Birth

While the specific causes of spontaneous preterm labor and delivery are largely unknown, research indicates that they are likely due to a complex interplay of multiple risk factors, as opposed to any single isolated risk factor. Approximately one quarter of all preterm births are the result of medical intervention, and the remainder occur spontaneously. (3)

- The most consistently identified risk factors include a history of preterm birth, current multifetal pregnancy, and some uterine and/or cervical abnormalities. (4)

- Other possible risk factors include: infection (especially genito-urinary), diabetes mellitus, hypertension, late or no prenatal care, smoking, alcohol and illicit drug use. (4)

- In Arizona in 2013, 10.2% of singleton births were preterm, compared to 58.3% of multiple births. Multiple births represent 3.0% of live births in Arizona. (1)

- Smoking is an important determinant of health and a significant factor contributing to preterm and low birthweight births. In 2013, 11.7% of women of childbearing age reported smoking in Arizona. (6)

- While being obese does not directly cause preterm birth, it does increase rates of medical complications (e.g., hypertension, diabetes) that do contribute to preterm birth. In Arizona, 24.3% of women of childbearing age were obese in 2013. (6)

Footnotes

- Preterm is less than 37 completed weeks of pregnancy. Late preterm is between 34 and 36 weeks gestation. Very preterm is less than 32 completed weeks.
- Low birthweight is less than 2500 grams (5 1/2 pounds). Very low birthweight is less than 1500 grams (3 1/3 pounds).
- 2020 rates based on U.S. Healthy People Objectives.
- All race categories exclude Hispanics.
- Women of childbearing age are defined as 18-44 years.
- Obesity is defined as a Body Mass Index of 30 or more.
