

2022 MARCH OF DIMES REPORT CARD DISPARITY RATIO DESCRIPTION

March of Dimes Report Cards are intended to spur action to improve equity and reduce premature birth with the goal of giving every mom and baby a fair chance for a healthy pregnancy and birth. The 2022 report card includes a disparity ratio that summarizes the overall level of racial and ethnic disparity in preterm birth rates in a geographic area and is used to measure and track progress towards the elimination of these disparities over time. This document describes the disparity ratio, how to calculate it and how you can use it in your work.

WHAT IS THE DISPARITY RATIO?

The disparity ratio is one of three ways that Healthy People 2020 recommends measuring gaps between groups (or disparities) in health outcomes¹ like preterm birth. The disparity ratio represents the overall level of disparity in a geographic area, which means that it accounts for gaps between *all racial/ethnic groups*, and all group rates influence the value of the disparity ratio. The disparity ratio is always a number greater than 1 (e.g., 1.26). A lower disparity ratio is better, with a disparity ratio of 1 indicating no disparity. You can see an example disparity ratio on the right.

To calculate the disparity ratio, we compare the racial/ethnic group with the lowest preterm birth rate to the average of the preterm birth rates for all other groups. This calculation is described more fully on the next page.

In our state example at right, the disparity ratio means: In State A, the average preterm birth rate among all groups (excluding the lowest group) is 1.26 times higher than the rate among the lowest group.

Healthy People 2020 published recommendations for how to best measure disparities in health outcomes.¹ One of the tools is the Healthy People 2020 summary rate ratio, which we're calling the disparity ratio. The disparity ratio can assure we're measuring disparities in the most accurate way so that our data are in line and comparable with data from other leading national organizations.

We'll use the disparity ratio to track progress in eliminating disparities over time within a state. To do this, we used data from 2012-2014 to calculate a baseline disparity ratio. We use this baseline ratio and the current ratio for 2019-2021 to see how much the level of overall disparity in a state has changed. In our state example, the level of overall racial/ethnic disparity in premature birth has not improved in State A from baseline.

We made analytic choices to help stabilize the racial/ethnic groups that are shown on the report card and used in the disparity ratio calculation. This means that you should not see racial/ethnic groups appearing and disappearing from your report card year to year.

HOW IS THE DISPARITY RATIO CALCULATED?

These are the steps we take to prepare each state's race/ethnicity data and calculate the disparity ratio.

1. Select the racial/ethnic groups that will be shown on the report card and included in the disparity ratio

Before we calculate the disparity ratio, let's review how racial/ethnic groups are selected for display on the report card and inclusion in the disparity ratio calculation.

We count the number of preterm births for each racial/ethnic group in a state for each year between 2012 and 2017. If the number of preterm births for a racial/ethnic group is less than 20 in any of those years, we drop the group and do not display the group on the report card or include it in the disparity ratio calculation. Groups that have 20 or more preterm births in each year are shown on this year's report card. These same groups will be shown on future report cards until 2023, unless the count of preterm births falls below 20 in a future year.

2. Select the racial/ethnic group with the lowest or best rate

After the racial/ethnic groups are selected, we then identify the group with the lowest preterm birth rate in the state. To do this, we add the data for all years between 2012 and 2017 and calculate a 6-year aggregate preterm birth rate for each racial/ethnic group that was not dropped in the first step. The group with the lowest 2012-2017 preterm birth rate is the group used as the lowest group for the disparity ratio for this year's report card and future report cards until 2023.

Steps 1 and 2 better stabilize the racial/ethnic groups included in each state's report card and disparity ratio year to year. Using the same groups each year to calculate the disparity ratio means we are measuring disparity in the same way each year. This is crucial for making comparisons over time.

3. Calculate the disparity ratio

First, we calculate the 2019-2021 preterm birth rate for all racial/ethnic groups that were not dropped in Step 1. Then, we average the 2019-2021 preterm birth rates for all racial/ethnic groups except the group with the lowest rate. We divide this average rate by the 2019-2021 preterm birth rate for the lowest group. The result is a number greater than 1 that we round to two decimals for the report card (e.g., 1.26). This number is the disparity ratio. See page 3 for an example of how we calculated the U.S. disparity ratio.

The disparity ratio methodology is based on recommendations provided in a Healthy People 2020 report published by the National Center for Health Statistics.¹ Three or more racial/ethnic groups are required to calculate the disparity ratio. The disparity ratio is not available for Maine, Vermont, West Virginia, Wyoming or Puerto Rico because data for these areas do not meet this requirement.

4. Determine if there has been change in the disparity ratio over time

To determine whether the disparity ratio changed over time, we need something to compare it to. We repeat Step 3 using data for 2012-2014 to calculate a baseline disparity ratio. Using statistical tests recommended by Healthy People 2020, we determine whether there was a statistically significant change (worsening or improvement) in the disparity ratio in each state between baseline (2012-2014) and the current time period (2019-2021). If the disparity ratio significantly improved because the average preterm birth rate for all other groups got better, we display "Improved" on the report card. If the disparity ratio significantly worsened because the lowest group got better or the average of all other groups got worse, we display "Worsened" on the report card. If the disparity ratio did not significantly change, we display "No Improvement" on the report card.

For the 2022 report cards, the U.S. as a whole and Illinois, Maryland, New Jersey, and Texas significantly worsened from baseline (meaning the disparity ratio increased and the gap between the lowest group and all other groups widened), so the U.S. and the states listed above have report cards that displays "Worsened". For the 2022 report cards there were no states that significantly improved from baseline (meaning the disparity ratio decreased and the gap between the lowest group and all other groups narrowed).

The table on [page 5](#) has information for each state and jurisdiction on the lowest group for each state; the baseline (2012-2014) disparity ratio; the current (2019-2021) disparity ratio; and the change in the disparity ratio from baseline.

U.S. DISPARITY RATIO CALCULATION

1. Select the racial/ethnic groups that will be shown on the report card and included in the disparity ratio

All five racial/ethnic groups had 20 or more preterm births in each year between 2012 and 2021, so no groups were dropped for the U.S.

2. Select the racial/ethnic group with the lowest or best rate

The racial/ethnic group with the lowest 2012-2017 aggregate preterm birth rate in the U.S. was Asian/Pacific Islander.

3. Calculate the disparity ratio

Preterm birth rates for 2019-2021 for all racial/ethnic groups are shown in the graph. We averaged the unrounded 2019-2021 preterm birth rates for White, Hispanic, American Indian/Alaska Native and Black. For demonstration purposes we are showing rates rounded to one decimal place: $(9.3 + 10.0 + 11.8 + 14.4) / 4 = 11.390$

Then, we divided this average rate by the 2019-2021 Asian/Pacific Islander preterm birth rate to get the unrounded disparity ratio: $11.390 / 9.02 = 1.26$

Finally, we rounded the disparity ratio to two decimals for display on the report card: 1.26

4. Determine if there has been change in the disparity ratio over time

We repeated Step 3 using 2012-2014 data to calculate the baseline U.S. disparity ratio of 1.22. We found that the increase in the U.S. disparity ratio from 1.22 to 1.26 was statistically significant. The U.S. report cards displays the current disparity ratio (1.26) and “Worsened” for change from baseline.

HOW CAN I USE THE DISPARITY RATIO?

You can use the disparity ratio to assess and describe how wide the gap is between the lowest racial/ethnic group in your state and everyone else and how the size of that gap is changing over time. The disparity ratio can be used to develop impactful statements that can help start a conversation with your partners and key stakeholders in your state. Here are two ways you can talk about our example U.S. disparity ratio of 1.26.

- Compared with the lowest group in the state, the average preterm birth rate among all other racial and ethnic groups is 1.26 times higher. This gap has not improved over the past seven years.
- Compared with the lowest group in the state, preterm birth rates among all other racial and ethnic groups are at least 26% higher. This gap has not improved over the past seven years.

You can also use the disparity ratio in combination with other race/ethnicity data to describe disparities in your state in more detail. Ideally, you want your state's disparity ratio to be as close to one as possible and to decrease over time, but the drivers of changes in the ratio vary from state to state. You should review the preterm birth rates among the individual racial/ethnic groups in your state to help you understand what is driving the size of the gap between the lowest group and everyone else and inform how you might act strategically to reduce your disparity ratio over time by targeting specific groups. For example, there might be one or two specific groups in your state that are experiencing much higher rates of preterm birth than the lowest group in the state, widening the gap and increasing the disparity ratio. Or all racial/ethnic groups in your state might have similar, higher preterm birth rates, resulting in a relatively small gap between groups.

WHERE CAN I FIND THE DISTRIBUTION OF BIRTHS BY RACE/ETHNICITY FOR MY STATE?

The disparity ratio does not adjust (or weight) for the distribution of births by race/ethnicity in a state. Rather, the ratio is based on the premise that all groups deserve equity in their outcomes, regardless of their relative size compared to other groups in a state. Understanding the distribution of births by race/ethnicity and coupling that information with the disparity ratio and the individual group preterm birth rates can help you better plan for programs targeting specific racial/ethnic groups. PeriStats (marchofdimes.org/peristats) has information on the distribution of live births for each U.S. state, the District of Columbia, and the U.S. Information is available as a 2019-2021 average, which corresponds to the race and ethnicity data presented on the report card.

LIMITATIONS

The March of Dimes implementation of the disparity ratio involves comparing two disparity ratios to each other to determine whether disparity has changed over time. When making these comparisons, it is important to ensure the disparity ratio measures are comparable. To ensure disparity ratios are comparable, we held the lowest comparison group constant over time. A consequence of holding the comparison group constant is that, for any given three-year disparity ratio, the comparison group used may not be the lowest group for that three-year period. In Tennessee, for instance, the comparison group used in this analysis was held constant (Asian and Pacific Islander women) even though from 2019-2021, the group with the lowest rate of preterm birth was among Hispanic women.

Given the priority made to comparisons over time, it is important to consider other metrics when evaluating disparities in preterm birth rates in a particular area. Healthy People 2020 recommends the use of three indicators, summary rate ratio, rate differences and rate ratios, in addition to the rates in each racial and ethnic group.

2022 PREMATURE BIRTH REPORT CARD

DISPARITY RATIO DESCRIPTION

DISPARITY RATIO BY STATE AND U.S., 2012-2014 AND 2019-2021

State	Racial/ethnic group with lowest preterm birth rate (2012-2017)	Baseline disparity ratio (2012-2014)	Current disparity ratio (2019-2021)	Change in disparity ratio from baseline*
United States	Asian/Pacific Islander	1.22	1.26	Worsened
Alabama	Asian/Pacific Islander	1.22	1.34	No Improvement
Alaska	White	1.24	1.46	No Improvement
Arizona	White	1.15	1.23	No Improvement
Arkansas	Hispanic	1.27	1.29	No Improvement
California	White	1.23	1.31	No Improvement
Colorado	White	1.14	1.25	No Improvement
Connecticut	Asian/Pacific Islander	1.29	1.27	No Improvement
Delaware	Asian/Pacific Islander	1.17	1.34	No Improvement
District of Columbia	Asian/Pacific Islander	1.37	1.41	No Improvement
Florida	Asian/Pacific Islander	1.15	1.22	No Improvement
Georgia	Asian/Pacific Islander	1.27	1.27	No Improvement
Hawaii	White	1.44	1.39	No Improvement
Idaho	White	1.16	1.36	No Improvement
Illinois	Asian/Pacific Islander	1.17	1.25	Worsened
Indiana	Asian/Pacific Islander	1.28	1.31	No Improvement
Iowa	Hispanic	1.19	1.10	No Improvement
Kansas	White	1.23	1.21	No Improvement
Kentucky	Asian/Pacific Islander	1.29	1.32	No Improvement
Louisiana	Hispanic	1.37	1.28	No Improvement
Maryland	Asian/Pacific Islander	1.12	1.26	Worsened
Massachusetts	Asian/Pacific Islander	1.21	1.21	No Improvement
Michigan	Asian/Pacific Islander	1.18	1.26	No Improvement
Minnesota	Asian/Pacific Islander	1.19	1.27	No Improvement
Mississippi	Asian/Pacific Islander	1.20	1.45	No Improvement
Missouri	Asian/Pacific Islander	1.20	1.22	No Improvement
Montana	White	1.28	1.34	No Improvement
Nebraska	White	1.12	1.26	No Improvement
Nevada	White	1.19	1.27	No Improvement
New Hampshire	Asian/Pacific Islander	1.09	1.17	No Improvement
New Jersey	White	1.15	1.33	Worsened
New Mexico	American Indian/Alaskan Native	1.26	1.16	No Improvement
New York	White	1.21	1.37	No Improvement
North Carolina	Asian/Pacific Islander	1.32	1.32	No Improvement
North Dakota	White	1.19	1.22	No Improvement
Ohio	Asian/Pacific Islander	1.29	1.23	No Improvement
Oklahoma	Asian/Pacific Islander	1.21	1.23	No Improvement
Oregon	White	1.15	1.20	No Improvement
Pennsylvania	Asian/Pacific Islander	1.35	1.30	No Improvement
Rhode Island	White	1.20	1.20	No Improvement
South Carolina	Asian/Pacific Islander	1.20	1.19	No Improvement
South Dakota	White	1.24	1.19	No Improvement
Tennessee	Asian/Pacific Islander	1.33	1.19	No Improvement
Texas	Asian/Pacific Islander	1.12	1.25	Worsened
Utah	White	1.10	1.24	No Improvement
Virginia	Asian/Pacific Islander	1.18	1.22	No Improvement
Washington	White	1.26	1.28	No Improvement
Wisconsin	Asian/Pacific Islander	1.27	1.43	No Improvement

Notes:

*The "Change in disparity ratio from baseline" column reflects only statistically significant change. The disparity ratio may appear to go up or down from baseline, but if the change is not statistically significant at p<0.05, the change is considered "No improvement."

The disparity ratio is not available for Maine, Vermont, West Virginia, Wyoming and Puerto Rico.
