WHERE YOU LIVE MATTERS: MATERNITY CARE IN OHIO

INTRODUCTION

With over 3.5 million births in the United States annually, and rising rates of maternal mortality and morbidity, there is ample opportunity to improve maternal outcomes across the country. More than 2 million women of childbearing age live in maternity care deserts, areas without access to birthing facilities or maternity care providers. Access to maternity care is essential for preventing poor health outcomes and eliminating health disparities. This report expands on the 2022 Nowhere to Go: Maternity Care Deserts Across the U.S. report by taking a deeper dive into state level data and examining additional barriers that impact access to care. This data can be used to inform policies and practice recommendations in each state.

This report presents data on several important factors: levels of maternity care access and maternity care deserts by county; distance to birthing hospitals; availability of family planning services; community level factors associated with prenatal care usage as well as the burden and consequences of chronic health conditions across the state. While not an exhaustive list, each of these topics contribute to the complexity of maternity care access in each state. Working to improve access to maternity care by bringing awareness to maternity care deserts and other factors that limit access is one way in which March of Dimes strives to reduce preventable maternal mortality and morbidity for all pregnant people.

ACCESS TO MATERNITY CARE IN OHIO

Access to care during pregnancy and around the time of birth is not consistently available across the country. Hospital closures and a shortage of providers are driving changes in maternity care access, especially within rural areas and among Black, Indigenous, and people of color (BIPOC). The level of maternity care access within each county is classified across Ohio by the availability of birthing facilities, maternity care providers, and the percent of uninsured women (see table). The map shows that in Ohio, 14.8 percent of counties are defined as maternity care deserts compared to 32.6 percent in the U.S. overall.

FINDINGS

• In Ohio, there was a 4.1% increase in the number of birthing hospitals between 2020 and 2019.

• In Ohio, there were 4,113 babies born in maternity care deserts, 3.2% of all births.

• 2.2% of babies were born to women who live in rural counties, while 0.2% of maternity care providers practice in rural counties in Ohio.

DEFINITIONS OF MATERNITY CARE DESERT AND LEVEL OF MATERNITY CARE ACCESS

DISTANCE TO MATERNITY CARE

The farther a woman travels to receive maternity care, the greater the risk of maternal morbidity and adverse infant outcomes, such as stillbirth and NICU admission. Furthermore, longer travel distances to care can cause financial strain on families and increased prenatal stress and anxiety. The distance a woman must travel to access care becomes a critical factor during pregnancy, at the time of birth, and in the case of emergencies. Nationwide closures of birthing hospitals have contributed to increased distance and travel time to care, especially in rural areas.

Mapping software was utilized to calculate distance, in miles and minutes, under normal traffic conditions and using real-world travel routes. The map indicates the average distance to the closest birthing hospital throughout Ohio. Commonly used thresholds of 30- and 60-minute driving times were applied to measure the percent of birthing people with timely access to care. This information can help identify areas where resources are needed to improve access to care. Overall, in the U.S. women travel 9.7 miles to their nearest birthing hospital.

FINDINGS

- In Ohio, women travel 9.2 miles and 14.7 minutes, on average, to their nearest birthing hospital.
- Women living in counties with the highest travel times (top 20 percent) could travel up to 34.5 miles and 46.0 minutes, on average, to reach their nearest birthing hospital.
- Under normal traffic conditions, 0% of women live over 60 minutes from their nearest birthing hospital compared to 1.0% in the U.S.
- 6.5% of women in Ohio had no birthing hospital within 30 minutes.
- In rural areas across Ohio, 23.4% of women live over 30 minutes from a birthing hospital compared to 6.2% of women living in urban areas.
- Women living in maternity care deserts traveled 2.8 times farther than women living in areas with full access to maternity care in Ohio.

On average, women in Ohio travel 9.2 miles to the nearest birthing hospital.

WHERE YOU LIVE MATTERS: MATERNITY CARE DESERTS AND THE CRISIS OF ACCESS AND EQUITY

Early and regular prenatal care (PNC) is an important strategy for reducing the risk of pregnancy complications and adverse birth outcomes. Historically, BIPOC have lower rates of adequate PNC and may be less likely to receive services such as important health screenings and appropriate monitoring of baby’s growth. Environmental factors, including crime rates, access to transportation and housing conditions create barriers to care that can worsen the disparity in PNC usage among BIPOC. The MVI defines areas where women are vulnerable to poor outcomes due to the physical environment. The impact of environmental factors on PNC usage was assessed by examining the percentage of women receiving inadequate PNC in areas with higher and lower vulnerability.

In Ohio, 14.5 percent of women received inadequate PNC compared to 14.8 percent in the U.S.

Finding:
- There are 3.7 Title X clinics per 100,000 women in Ohio compared to 5.3 per 100,000 in the U.S. overall.
- Women living in 50.0% of counties in Ohio have a very high or high vulnerability to adverse outcomes.
- On average, people living in maternity care deserts in Ohio, travel 1.9 times farther to reach their nearest Title X clinic compared to people living in full access counties.

CHRONIC HEALTH CONDITIONS AND PRETERM BIRTH

Having a chronic health condition before pregnancy increases the risk of pregnancy and postpartum complications. Preterm birth (PTB), a delivery before 37 weeks gestation, is one example of a complication that can lead to serious health impacts. The burden of chronic health conditions among birthing people is increasing across the U.S. Access to healthcare before, during, and after pregnancy is important for appropriate management of chronic health conditions. At the time of birth, women with chronic conditions and their babies may need access to higher-level care, such as specialized providers, hospitals with the ability to perform a Cesarean birth, or hospitals with NICUs. Examining the chronic health burden (CHB) across Ohio and its relationship to adverse outcomes provides information needed to make important changes that can result in targeted resource allocation, prevention, and appropriate disease management.

The percent of birthing people with one or more chronic conditions was calculated for each county in Ohio and overall. The following conditions were included due to their availability in birth record data and established association with PTB: pre-pregnancy hypertension and diabetes, smoking, and being underweight or obese before pregnancy. The map describes the county level CHB in relation to the PTB rate. Areas shaded in purple have both a high CHB, greater than the overall state percent, and a high rate of PTB, defined as greater than the national target of 9.4 percent. In Ohio, the PTB rate was 10.6 percent, compared to 10.5 percent in the U.S. overall in 2021.

FINDINGS

- In Ohio, 44.8% of women had one or more chronic health conditions compared to 37.8% in the U.S. overall.
- Women with one or more chronic health conditions have a 59% increased likelihood of having a preterm birth compared to those without any chronic health conditions.
- 59.1% of counties in Ohio have a high burden of chronic health conditions and a high rate of preterm birth.

SUMMARY

All women deserve healthcare which is safe, effective, timely, efficient and equitable. Consistent and equitable access to maternity care helps women maintain optimal health as well as reduce the risk of experiencing complications during pregnancy and the postpartum period. Several factors influence maternity care access for women across the U.S. By assessing distance to care and the availability of maternity care providers, hospitals and family planning services, this report provides insight into several physical components that affect a person’s ability to receive care. In addition, examining community level factors associated with access to care and identifying vulnerable populations provides greater context around barriers to receiving appropriate care. Together this information can lead decision makers, public health professionals, clinicians and researchers to advocate for policies and resources that increase maternity care access across each state.

By addressing these factors, states may move closer to eliminating pregnancy-related deaths and complications. Telehealth, through various platforms, equips maternal health providers with the tools to better facilitate care before, during and after pregnancy and has been shown to not only increase access but also improves patient engagement and treatment. March of Dimes fully supports Congress, governmental regulating agencies and states to act and make telehealth provisions balanced and permanent. Evidence-based telehealth services and other innovative solutions are explored in greater depth on page 5.

March of Dimes has long supported policies that improve access to maternity care, including Medicaid expansion and extension, improved integration of the midwifery model of care, reimbursement for doula care, and increasing the availability of telehealth services across a range of healthcare specialties. Telehealth is healthcare delivered using technology to replace or enhance in-person care and can save lives by providing high-quality care for pregnant and postpartum people. Women who are underserved, vulnerable to poor health outcomes, and have limited access to high-risk care can greatly benefit from telehealth.

To address the limited access to maternity care in the U.S., states must adopt and support telehealth and other innovative practices to expand access and provide more options for healthcare delivery. The current state of telehealth policies and innovative solutions in Ohio aimed at improving maternal health outcomes is explored in this report. By highlighting innovative solutions implemented across states, policymakers and healthcare professionals can identify policies and programs that can improve health for pregnant people in Ohio and ensure they receive the support and care needed before, during, and after pregnancy.

**OHIO**

**POLICY SOLUTIONS AND ACTIONS**

Due to the COVID-19 Public Health Emergency (PHE), states expanded access to telehealth services. While many of the policies increased access to telehealth for maternity care services temporarily, many states permanently expanded telehealth services. This policy measure identifies whether Ohio has passed laws to permanently provide Medicaid telehealth coverage for maternity care services.

**TELEHEALTH LAW**

Due to the COVID-19 Public Health Emergency (PHE), states expanded access to telehealth services. While many of the policies increased access to telehealth for maternity care services temporarily, many states permanently expanded telehealth services. This policy measure identifies whether Ohio has passed laws to permanently provide Medicaid telehealth coverage for maternity care services.

**TELEHEALTH COVERAGE**

Medicaid telehealth policies vary by state. States may cover all forms of telehealth services or restrict certain forms of telehealth services. This policy measure identifies whether Ohio provides Medicaid reimbursement of the following telehealth services:

- Live video
- Remote patient monitoring
- Audio-only

**POLICY AND PROGRAM INNOVATION**

- Ohio offers Medicaid presumptive eligibility for pregnancy-related services.
- Ohio Department of Medicaid administers the Comprehensive Maternal Care (CMC), a community-based, statewide program aimed at improving the health and well-being of moms, infants, and families covered by Medicaid. The program provides support for obstetrical practices to develop community connections and culturally aligned supports for women with Medicaid as they and their families navigate pre- and postnatal care. It creates a framework for providers and community partners to work together to develop person-centered, customized interventions to support women and families who've historically lacked ready access to high-quality responsive care before and after pregnancy. The CMC model uses an innovative payment structure, creating financial opportunities for maternal care providers to address patient and family needs across the entire cycle of childbearing-prenatal, birth, and postnatal.
