PREMATURITY PROFILE
SOUTH CAROLINA

IN AN AVERAGE WEEK IN SOUTH CAROLINA

1,071 babies are born
126 babies are born preterm
92 babies born late preterm
19 babies are born very preterm

PRETERM BIRTH RATE IN SOUTH CAROLINA
PERCENTAGE OF LIVE BIRTHS

PRETERM BIRTH RATE, 2011-2020

PRETERM RATES BY COUNTY, 2017-2020 AVERAGE

- In 2020, there were 6,576 preterm births in South Carolina, representing 11.8% of live births.
- In 2020, 1 in 9 babies (11.8% of live births) was born preterm in South Carolina.

Every baby in South Carolina deserves the chance to be born healthy.

- In 2017-2020, 29 South Carolina counties had a preterm birth rate higher than the state rate of 11.5%.
- In 2017-2020, no South Carolina county had met the March of Dimes preterm rate goal of 9.4%.

©2022 March of Dimes
The March of Dimes is concerned about inequities in health and health care that contribute to higher rates of preterm birth among different racial and ethnic groups.

### Preterm Birth by Race and Ethnicity

**Percentage of Preterm Live Births (2018-2020 Average)**

<table>
<thead>
<tr>
<th>Race/Ethnicity</th>
<th>Percentage</th>

<td>11.6</td>
</tr>
<tr>
<td>Asian/Pacific Islander</td>
<td>10.5</td>
</tr>
<tr>
<td>Total</td>
<td>11.5</td>
</tr>
</tbody>
</table>

- During 2018-2020 (average) in South Carolina, preterm birth rates were highest for black infants (15.2%), followed by American Indian/Alaska Natives (11.6%), Asian/Pacific Islanders (10.5%), Hispanics (10.0%) and Whites (9.9%).
- Black infants (15.2%) were about 2 times as likely as White infants (9.9%) to be born preterm during 2018-2020 (average).
- Of all live births in South Carolina during 2018-2020 (average), 10.0% were Hispanic, 56.3% were white, 30.1% were black, 0.2% were American Indian/Alaska Native and 2.3% were Asian/Pacific Islander.

### Consequences of Preterm Birth

Preterm birth, along with low birth weight babies, make up the second leading cause of infant deaths after birth defects. Health consequences of preterm birth include developmental delays, chronic respiratory problems and vision and hearing impairment. Having a preterm baby impacts families emotionally and financially.

#### 36.7%

Infant deaths are preterm-related

When causes of death related to preterm birth are grouped together, preterm-related causes account for 36.7% of infant deaths in South Carolina. (See figure)

#### $63,000

Associated with preterm birth

The annual societal economic cost (medical, educational, and lost productivity) associated with preterm birth in South Carolina is an estimated $63,000.

**RISK FACTORS FOR PRETERM BIRTH**

Rather than having one cause, preterm birth seems to be triggered by multiple, interacting biologic and environmental factors. We do know that a history of preterm birth, multiple gestations, and certain uterine and/or cervical problems are the strongest risk factors for preterm birth. The factors below also contribute to preterm birth.⁴

<table>
<thead>
<tr>
<th><strong>MATERNAL AGE</strong></th>
<th><strong>SMOKING</strong></th>
<th><strong>MULTIPLE BIRTHS</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>During 2018-2020 (average) in South Carolina, preterm birth rates were highest for women ages 40 and older (17.9%), followed by women ages 30-39 (12.0%), under age 20 (11.2%) and ages 20-29 (10.9%).</td>
<td>In 2020, 18.2% of women of childbearing age reported smoking in South Carolina. Smoking is an important determinant of health and a significant factor contributing to preterm births.</td>
<td>In South Carolina in 2020, 9.9% of singleton births were preterm, compared to 65.4% of multiple births. Multiple births represent 3.5% of live births in South Carolina. Current multifetal pregnancy is one of the most consistently identified risk factors for preterm birth.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>BIRTH SPACING</strong></th>
<th><strong>OBESITY</strong></th>
<th><strong>HEALTH INSURANCE COVERAGE</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Birth spacing, or inter-pregnancy interval, is the timing between a live birth and the beginning of the next pregnancy. Birth spacing of less than 18 months increases the risk of preterm birth and other adverse outcomes. In South Carolina, 31% of pregnancies with a prior live birth have a birth spacing of less than 18 months (2018-2020 average).</td>
<td>While obesity does not directly cause preterm birth, it does increase rates of medical complications (e.g., hypertension, diabetes) that contribute to preterm birth. In South Carolina, 38.8% of women of childbearing age were obese in 2020.</td>
<td>In 2020, about 1 in 8 women of childbearing age (12.9%) was uninsured in South Carolina. Health care before, during and after pregnancy can help identify and manage conditions that contribute to preterm birth.</td>
</tr>
</tbody>
</table>

**OTHER CONTRIBUTING FACTORS⁴**

Other factors contributing to preterm birth include: infection (especially genito-urinary), diabetes mellitus, hypertension, late or no prenatal care, alcohol and illicit drug use, and social determinants of health. Socioeconomic status at both the individual and community level (e.g., income/poverty, job status, education) as well as psychosocial factors (e.g., chronic stress, lack of social support) are associated with an increased risk of preterm birth.
MARCH OF Dimes MISSION

March of Dimes leads the fight for the health of all moms and babies. We support research, lead programs and provide education and advocacy so that every baby can have the best possible start. Building on a successful 80-year legacy of impact and innovation, we empower every mom and every family.

FOOTNOTES

1. Preterm is less than 37 weeks of pregnancy.
2. Late preterm is between 34 and 36 weeks gestation.
3. Very preterm is less than 32 weeks.
4. All race categories exclude Hispanics.
5. Smoking is defined as having ever smoked 100 cigarettes in a lifetime and currently smoking everyday or some days. Percent reported is among women ages 18-44.
6. Multiple deliveries include twin, triplet and higher order deliveries.
7. Birth spacing is the period of time between giving birth and getting pregnant again. Its also called pregnancy spacing or interpregnancy interval (also called IPI).
8. Obesity is defined as a Body Mass Index of 30 or more. Body Mass Index (BMI) is a number calculated from a person’s weight and height. Percent reported is among women ages 18-44.
9. A woman was considered uninsured if she was not covered by any type of health insurance at the time of the survey. Percent reported is among women ages 15-44.
10. Social determinants of health are the conditions in which people are born, grow, work, live and age, as well as the wider set of forces and systems that shape daily life conditions.
11. Prematurity/LBW cause of death is a single cause of death defined as disorders related to short gestation and low birthweight (LBW), not elsewhere classified, determined by Category P07 (four codes) in the tenth International Classification of Diseases (ICD-10).
12. Preterm-related cause of death is a grouping of causes of death each determined to be a direct consequence of preterm birth (44 codes from the tenth International Classification of Diseases (ICD-10)).
